STATE THE PROBLEM

How do we know how a family member or loved one is doing, especially if separated by distance? For example, if you're concerned about the well being of an aging parent, or of a friend going through a hard time, how might you check in on them without intruding or surveilling? How can we respect the privacy of our loved ones while being there for them?

WHY MOZILLA SHOULD FOCUS ON THIS CHALLENGE

Mozilla champions user control and informed consent around data. Many IoT monitoring products presume someone has permission to watch or track another (i.e. parent to kid, caretaker to aging relative). How can we make data preferences clear and enforced, even if monitoring is among loved ones?
